

First Meeting with client minutes:

Introductions

His introduction:

- Recycling and sustainability is a domain in his work
- AI based optimisation is somewhere that the company wants to go
- Might be a larger scope based on the environmental

SPACENXT LABS

Shared screen with a presentation about his company

- Aerospace and sustainability
- R&D on drones
- Dronenxt
- Asawesome.ai
- Recyclenxt

- **Use a Calendar:** Track schedules, deadlines, and milestones with a shared calendar.
- **Arrange Weekly Meetings:** Hold regular meetings within the group to review progress and plan tasks.
- **Collaborative Documents:** Maintain shared documents for real-time updates and contributions.
- **Group Leader:** Appoint a leader to coordinate efforts and manage meetings.
- **Group Respondent:** Assign a contact person for communication with the supervisor.
- **Follow Timelines:** Adhere to deadlines and timelines outlined in briefing documents.
- **Query Supervisor:** Send questions to the supervisor's email as listed in the briefing.
- **MS Teams Accounts:** Request MS Teams access if needed for collaboration.
- **Effective Communication:** Keep open and clear communication within the team.
- **Document Progress:** Record work and decisions for easy tracking and updates.
- **Notify Absences:** Inform the team in advance about any planned leave or unavailability.
- **Be Prompt on Email:** Check and respond to emails promptly, as email is our primary communication medium.

- Monthly meetings or go down to a needs basis
- Most communicating via email (3/4 emails in a month)
- Interdependent research done by us
- [Linkedin.com/company/spacenxtlabs](https://www.linkedin.com/company/spacenxtlabs)

Recycle nxt → makes bags using recycled bottles

- Lots of stages
- Plastic waste pickup stage

- There is a logistic partners that does this
- Want to optimise the waste collection → collecting the plastic bottles
- Factory based in India and import the fabric
- Previously manually got info about how much of the waste is collected
- All info collected manually
- Want to learn the patterns
 - Different month
- Can we predict the collection of waste before it happens
- When do we know when to get it
- How much can we store out of our facility
- App provided to large communities which will let them enter data in exchange for tokens
- How can we track the data
- Just plastic but also think about the others
- Currently based on Chennai but we can do it based on any city we want (Bristol would make sense)
- So many routes so we need AI prediction to help
- Look into mock data → generate it
 - See document
- Offer suggestion on how we can use tech to optimize the process
- We can suggest anything on waste management

Data to generate:

- Excel sheet
- What are the input parameters that will minimise the
- Duration, cost

Experimental study

Base our study on Bristol and can reach out to other unis in the city or surrounding area

Entire life cycle analysis

- He will send us the sages of the life cycle
- Optimise in terms of:
 - Emissions and fuel consumption → large part of this is Route planning
 - Distance covered by the trucks
 - How to track the data when it comes to waste disposal
 - What type of waste
 - When is it being disposed
 - How much and when
 - Is there any practical way to track the amount of waste being collected
 - Smart bin technology → so that the bin tracks what is put in the bin using computer vision (colour, dimension, shape, and of what
 - Talk to litter recognition and potentially integrate our tech with them

1. Emotions, distance, route
2. Smart bins → work out where the waste is, the pattern of waste disposal
 - a. Meaning we can see the areas we will need to look at

Note: reply within 2 days

Feel free to share any case study or anything we find

Next steps:

1. Brainstorm and write any more questions
2. Connect with college that can answer more technical questions
3. One more meeting this month
4. After we have discussed we will schedule another meeting
